Phase #1 Test Plan

- **Directory Structure**: All tests are located in a root /tests directory, with specific sub-directories for each transaction type: /login, /logout, /withdrawal, /transfer, /paybill, /deposit, /create, /delete, /disable, /change_plan, and /availability

- **File Naming**: Each test case consists of two text files: an input file (_in.txt) representing the simulated user keystroke stream and an expected output file (_out.txt) representing the anticipated system console response.

- **Execution**: We will use a Bash shell script to automate runs. The script will feed the _in.txt files into the program's standard input.

- **Reporting**: We will use the diff command to compare the actual program output against our _out.txt files. Any differences will be logged as a failure.
